Project Assignment #7a

Group Name : HiddenCampers

Since our system is aimed at finding campsites, we have decided to proceed with a summative approach. During our paper prototyping phase we already tried a formative technique where we figured out the bugs and lack of functionality in our system. Not only did we fix that in our working prototype, we finally gripped on a design we're confident about, so a formative testing outlook isn't needed anymore.

Summative testing will allow us to test our working prototype against existing systems that offer such functionality. We will be doing this to determine the successes in our system, two of them primarily being - finding quality campgrounds and doing that in a short span of time.

Our way to go about this would be to gather users and give them tasks that are representative of what our system intends to do.

We are planning to gather our users mostly from Marino Center , Curry Student Center other public areas on campus.

Our study would involve testing about 20-30 people with varying demographics. This would give us a clear idea through different perspectives so we can come up with relevant results.
